REACT

composition

The composition modality defines the way how components communicate which each other.

A coupled composition means that one component is the owner of another component.The owning component can be considered as a parent, while the owned component becomes a child.This kind of coupling leads to a typical component hierarchy with parent and children components.

A decoupled composition is used when none of the components is owner, nor owned.These components exist on the same screen, nevertheless they are not bound or related to each other
